

TME-2200 Rakenteiden mekaniikka

2. välikoe 24.5.2010 (uusinta)

1. Määritä vääntösauvan, jonka poikkileikkaus on kuvan ellipsi, vääntöneliömomentti käyttämällä estimaattia

$$\tilde{f}(y,z) = \frac{c^2 - b^2}{c^2 + b^2} yz$$

$$I_z = \frac{1}{4} \pi b^3 c, \quad I_y = \frac{1}{4} \pi b c^3$$

2. Kuvan ulokepalkin poikkileikkauksen uuman korkeus on  $h$  ja laippojen leveys  $b$ . Määritä palkin bimomentin lauseke  $B(x)$  ja vapaan pään kiertymä. Palkin poikkileikkauksen jäykkyydet  $GI_v$  ja  $EI_\omega$  tunnetaan.

3. Kuvan palkin poikkileikkaus, joka on suorakulmio  $b \times h$ , murtuu, kun venymä vetopuolella saavuttaa arvon  $\epsilon_{mu}$ . Määritä poikkileikkauksen plastinen momentti  $M_p$ .

4. Määritä kuvan kehän rajakuormitus *kinemaattisella menetelmällä*. Käytä mekanismia, jossa pystypalkilla on plastisia niveliä, joiden paikat ovat tuloksen tarkkuuden kannalta parhaimmat mahdolliset.

## 2305410 Palkkirakenteet

Kaavakokoelma/Tapio Salmi sl. 2003
